FIG. 6

```
graph TD; 100([100 Client Begin]) --> 110[110 Client Creates Source ID Packet]; 110 --> 120{120 Source ID packet sent to FRC}; 120 --> 200((200));
```

A source ID packet may include:

- Identification Dataset, which may contain client identification and requestor identification
- Request Dataset, which may contain credit requested, resources requested, and criteria requested

The flowchart illustrates the process of creating a source ID packet. It begins at step 100, 'Client Begin', which leads to step 110, 'Client Creates Source ID Packet'. A callout box points to step 110, detailing the components of a source ID packet: an Identification Dataset (containing client and requestor identification) and a Request Dataset (containing credit, resources, and criteria requested). The process then moves to step 120, a decision diamond labeled 'Source ID packet sent to FRC'. From step 120, the flow proceeds to step 200, 'End'.
